SUMMARY

Professional Developer with experience handling large scale full-stack systems, safely accessing databases, and building / maintaining products through CICD pipelines. Recently built [Portfolio](#), a monorepo web application platform to host my past and future projects. Fast, adaptive learner with strong problem-solving skills acquired through a diverse range of challenges.

EDUCATION

Bachelor of Science – Mathematics

University of British Columbia, Vancouver, BC

Graduated: May 2025

GPA: 3.20

Relevant coursework: Data Structures, Software Construction, Applied Machine Learning, Linear Programming, Linear Algebra, Data Analysis

TECHNICAL SKILLS

Languages: Python, JavaScript, Java, C, C++, R, SQL, HTML, CSS, VBA

Frontend: React, Tailwind, CSS, AG Grid, Highcharts, MaterialUI

Backend: Node.js, Express, Axios, CORS, Kubernetes, Flask, Druid, minIO, Apache Airflow, DAGs

Tools/DevOps: Git, Gitlab, JUnit, GDB, Alembic

Libraries/Frameworks: numPy, Pandas, Polars, scikit-learn, NEAT, openpyxl

WORK EXPERIENCE

Full-Stack Analyst

Sep 2025 – Aug 2026

Bank of Montreal - Toronto ON

- Built and maintained two client scorecard applications serving 50+ users; implemented custom ETL pipelines to efficiently fetch and aggregate data from multiple DB tables, an excel exporter supporting rich text, tables, and charts, and historical data lookback.
- Aided in the migration to MFE from existing bundle monorepo; updated component and render library to use latest MUI packages, performed unit, integration, and snapshot testing, and completed migration for the above scorecard applications.
- Refactored authentication to close a gap where endpoints outside our bundle could be hit programmatically without cost. Implemented a login endpoint issuing tokens and a shared-library decorator that validates those tokens on every subsequent request.
- Modified existing and created Airflow DAGs to automate data processes
- Provided service support for a team maintaining forex trading applications, debugging issues across APIs consumed from multiple interdependent repositories and dependencies
 - Migrated core messaging infrastructure from SocketIO to AMPS, created data verification pipeline improving message delivery reliability for real-time trading data
 - Co-mentored a co-op student on the same team, onboarding them to the relevant repositories and overseeing their contributions throughout the term

PERSONAL PROJECTS

Portfolio | *React, Node.js, Tailwind, Git*

Aug 2026

- Designed and developed a bilingual portfolio website with light and dark mode support, built on a React monorepo architecture with a unified Express backend serving multiple applications from a single origin
- Engineered a component library with structured content and styling data objects, easily enabling language switching, theme toggling, and a dynamic app preview interaction that transitions seamlessly into fully embedded applications

StarSync | *React, Node.js, Tailwind, Git*

May 2025

- Developed a modern, cross-platform, full-stack web application that displays music statistics and generates user insights by utilizing the Spotify API
- Built the system from the bottom up, using Node/Express for the backend, React/Tailwind for a dynamic frontend, and Axios/CORS to manage secure, asynchronous communication.
- Architected the application as a workspace package within a React monorepo, integrating it into a larger platform with shared routing and a unified Express backend
